## Point of Care Ultrasound Training & Credentialing Handbook

### NEONATAL CRANIAL ULTRASOUND

Monash Newborn  
*Handled with Care*

Monash**Imaging**  
Monash**Health**

A collaborative program of Monash Newborn & Monash Imaging  
supporting excellence in clinician performed ultrasound

# Overview

## Introduction

- Overview of collaborative PoCUS training program
- Process for Monash Health Neonatal Cranial module accreditation
- Booking one-to-one training sessions

## Ultrasound System

- Knobology
- Entering patient details
- Infection control
- Equipment care

## Scanning

- Safety
- Scan module protocol & imaging
- Practical scan skills
- Grading of intracranial haemorrhages

## Scan Results

- Documenting findings on EMR

## Other matters

- PACS upload of images
- Clinician logbooks
- Quality auditing & clinician feedback

# SAMSUNG KNOBOLOGY

1. Gain
2. TGC
3. Depth (press to change)
4. Focal Zone (press to change)
5. Freeze
6. Acquire (save image)
7. Patient ID
8. Transducer & Preset (exam) selection
9. Set/Activate
10. Measure (calipers)
11. Erase (calipers or text)
12. Text (labelling)
13. End Exam (archive)

# ENTERING PATIENT DETAILS

The screenshot displays a medical ultrasound machine's patient entry interface. The interface is divided into two main sections. The top section contains fields for Patient ID (0000000), Last (Family) (POCUS), First (Given) (NICU), Middle, Accession #, Birth date (00/00/0000), Age (y/m), Gender (Female, Male, Trans, Other), and buttons for New, a star icon, and Auto ID Creation. The bottom section contains fields for Diag. Physician, Ref. Physician, Description (POCUS), Sonographer (DR PRAMOD PHARANDE), and buttons for Edit and a checkbox for 'Reset to blank with End Exam'. Colored circles highlight specific fields: a blue circle around Patient ID, Last, and First; a green circle around Accession #; an orange circle around Description; and a red circle around Sonographer.

Prior to scanning you must enter the **patient details**, **study description** and **sonographer** into the required fields.

This will enable us to send the images to PACS, perform auditing and collect data to create your personal physician logbooks.

Note: If the patient has been scanned previously the machine will automatically pre fill the patient details for you. You **MUST** delete the characters in the **Accession #** field to prevent your scan going into the previous study.

## INFECTION CONTROL

- Only use detergent or water based cleaning wipes to clean ultrasound transducers, cords & consoles (NOT alcohol)
- Wipe off excess gel from transducers BEFORE using cleaning wipes to clean thoroughly
- Wipe machine console and probes over with a dampened microfiber cloth to remove residue of detergent wipe
- ALWAYS use dedicated transducer covers for procedures or when in contact with fluids/blood/exposed body tissues (NOT Tegaderm)

## EQUIPMENT CARE

- Store transducers correctly in holders
- Do not drop or knock transducers
- Keep cords and cables tangle free & off the floor
- Do not run over cords!
- **Ensure machine is returned to parking area with POWER CORD PLUGGED IN**

**PLEASE REPORT ALL FAULTS/DAMAGE IMMEDIATELY**

**Call ultrasound department on ext. 23028**

# CRANIAL Ultrasound

## Safety Recommendations

Scan time should not exceed 6 minutes

Use 'NICU Cranial' machine preset to ensure appropriate output power settings are utilised

### Why?

- Potential for focal increase in temperature as the transducer sits very close to the surface of the brain
- The bone soft tissue interface (i.e. the anterior fontanelle) is where acoustic energy absorption is at its maximum
- Excessive tissue heating from a prolonged scan time in essentially the same position (anterior fontanelle) can cause damage to the underlying neurons

**Do not use the cardiac or research machines to scan cranial cases.**  
**Power levels are not configured for safe cranial scanning.**

# Neonatal Cranial Image Series

## Plane 1 – CORONAL: MIDDLE CEREBAL ARTERIES (MCAs)

- Use the curvilinear (C9-4) transducer on '**NICU Cranial**' preset
- Place transducer on anterior fontanelle, ensuring the transducer marker is positioned to the anatomical right of the patient (marker at 3 o'clock)
- Increase depth to ensure entire brain is demonstrated on the image
- Assess the entire brain parenchyma by sweeping anteriorly (towards the face) and then as far posteriorly as possible
- Obtain a coronal view of brain at level of MCAs
- Anatomy visualised should include the MCAs, frontal horns of lateral ventricles and corpus callosum
- Identify presence/absence parenchymal haemorrhage
- Labelled CORONAL RIGHT (right must be on anatomical right of patient)

# Neonatal Cranial Image Series

## Plane 2 – CORONAL: THIRD VENTRICLE

- Angle the probe slightly posteriorly until a coronal view of the brain is obtained at level of the third ventricle
- Demonstrate the third and lateral ventricles, corpus callosum, caudate nucleus, cavum septum pellucidum (CSP) and Sylvian fissures
- Identify presence/absence of subependymal haemorrhage (SEH), intraventricular haemorrhage (IVH) and parenchymal haemorrhage
- Look just below the ventricles for evidence of germinal matrix haemorrhage (GMH)
- Labelled CORONAL RIGHT (right must be anatomical right of patient)

# Neonatal Cranial Image Series

## Plane 3 – CORONAL: TENTORIUM CEREBELLI

- Continue angling the probe posteriorly until a coronal view of the brain is obtained at the level of the tentorium cerebelli
- Demonstrate the tentorium cerebelli, lateral ventricles and falx cerebri
- Identify presence/absence of IVH and parenchymal haemorrhage
- Labelled CORONAL RIGHT (right must be anatomical right of patient)

# Neonatal Cranial Image Series

## Plane 4 – CORONAL: POSTERIOR PARENCHYMA

- Continue angling the probe posteriorly until a coronal view of the posterior parenchyma of the brain is obtained
- Demonstrate the falx cerebri and occipital lobes
- Identify presence/absence of parenchymal haemorrhage
- Assess the surrounding periventricular white matter for areas of gross increased echogenicity (brighter than choroid)
- Labelled CORONAL RIGHT (right must be anatomical right of patient)

# Neonatal Cranial Image Series

## Plane 5 – RIGHT SAGITTAL: CAUDOTHALAMIC (CT) GROOVE

- With the transducer in the anterior fontanelle, turn the transducer so the marker on the transducer is now pointing to 12 o'clock (towards the face).
- Fan the probe to the patients right side until a longitudinal view right sagittal caudothalamic (CT) groove is demonstrated
- Include the entire depth of the brain in image
- Demonstrate the ventricle, caudate nucleus, thalamus and CT groove
- Distinguish choroid from haemorrhage
- Identify presence/absence of SEH, IVH and parenchymal haemorrhage
- Labelled SAG RIGHT

# Neonatal Cranial Image Series

## Plane 6 – SAGITTAL MIDLINE

- Fan the probe to the medially obtaining a longitudinal view midline brain
- Include the entire depth of the brain in image
- Demonstrate the corpus callosum, septum pellucidum, third and fourth ventricle and cerebellar vermis
- Identify presence/absence of parenchymal haemorrhage
- Labelled SAG MIDLINE

# Neonatal Cranial Image Series

## Plane 7 – LEFT SAGITTAL: CAUDOTHALAMIC GROOVE

- Continue fanning the probe to the patients left obtaining a longitudinal view left sagittal CT groove
- Include the entire depth of the brain in image
- Demonstrate the ventricle, caudate nucleus, thalamus and CT groove
- Distinguish choroid from haemorrhage
- Identify presence/absence of SEH, IVH and parenchymal haemorrhage
- Labelled SAG LEFT

# Alternate Neonatal Cranial Views

- If pathology is found use depth, gain, TGC & focal zone to improve image detail for the region of interest
- Document all pathology in two planes i.e coronal and sagittal
- Annotate images with RIGHT/LEFT

# Grading of Neonatal Intracranial Haemorrhage

Papile*		Volpe†	
Grade	Description	Grade	Description
Grade 1	Germinal matrix hemorrhage	Grade I	Germinal matrix hemorrhage with no or minimal hemorrhage
Grade 2	Blood within but not distending ventricular system	Grade II	IVH (10–50% of ventricular area)
Grade 3	Blood filling and distending ventricular system	Grade III	IVH (>50% of ventricular area; usually distends ventricle)
Grade 4	Parenchymal involvement of hemorrhage	Severe + periventricular hemorrhagic infarction	Grade III IVH with periventricular hemorrhagic infarction

\* (Data from Papile LS, Burstein J, Burstein R. Incidence and evolution of the subependymal intraventricular hemorrhage: A study of infants with weights less than 1500 grams. J Pediatr 1978;92:529.)

† (Data from Volpe JJ. Neurology of the newborn, 3rd edn. Philadelphia: WB Saunders, 1995:424–428.)

At Monash Health we grade haemorrhages from grade 1-3. Grade 4, historically thought to be an extension of the SEH, has since been recognised to be a separate process not involving the germinal matrix.

These parenchymal (grade 4) haemorrhages are thought to be due to haemorrhagic venous infarction, as a result of compression of the brain parenchyma by distention of a ventricle.

# Grading of Neonatal Intracranial Haemorrhage

**Grade 1 haemorrhage. Germinal matrix haemorrhage (GMH) which is confined to the CT groove. No extension into the ventricle, no ventricular distension.**

# Grading of Neonatal Intracranial Haemorrhage

**Grade 2 haemorrhage. GMH which has extended into <50% of the ventricle.  
No ventricular distension.**

# Grading of Neonatal Intracranial Haemorrhage

**Grade 3 haemorrhage. GMH which has extended into >50% of the ventricle *with* ventricular distension.**

# Grading of Neonatal Intracranial Haemorrhage

**Grade 4 haemorrhage/ parenchymal haemorrhage. May be associated with IVH but can also be seen independently from it.**

# Recording Findings

All PoCUS examinations **must** be documented with images and clinician record of scan findings.

Record your examination on EMR under the AdHoc tool in the top left of the screen, select PoCUS and then LIMITED CRANIAL under the NICU heading.

The screenshot shows the PoCUS Form interface. The top left menu has 'AdHoc' highlighted. The main form is titled 'PoCUS Form' and includes a sidebar with various examination categories. The 'NICU' heading is selected, and the 'LIMITED CRANIAL' option under the 'Neonatal Intensive Care' section is highlighted with a red circle. Other categories include Emergency, Intensive Care, Paediatric Intensive Care, Respiratory, Cardiothoracic Surgery, and Gastroenterology.

Emergency	Intensive Care	Respiratory
<input type="radio"/> #FAST/AAA	<input type="radio"/> PLEURAL/LUNG	<input type="radio"/> PLEURAL
<input type="radio"/> FOCUS ECHO	<input type="radio"/> FOCUS ECHO	
<input type="radio"/> RENAL/RUQ		
<input type="radio"/> LIMITED DVT	<input type="radio"/> PLEURAL/LUNG	<input type="radio"/> PLEURAL/LUNG
<input type="radio"/> BELS/HEART FAILURE	<input type="radio"/> BLADDER	<input type="radio"/> LIMITED ABDG

**Neonatal Intensive Care**

- ☒ LIMITED CRANIAL

# Recording Findings

The screenshot shows a software interface for recording PoCUS findings. At the top, a blue header bar reads "PoCUS LIMITED CRANIAL". Below this, there are fields for "Examination Date and Time" (with a date picker showing "no time passed"), "Scan Supervised by:" (with a text input and a magnifying glass icon), and "Clinical Reason for Performing Scan:" (with a text input). A blue bar labeled "RIGHT" indicates the side of the scan. Below this, four sections are listed, each with a radio button selection: "RT Caudothalamic Groove Haemorrhage:", "RT Intraventricular Haemorrhage:", "RT Parenchymal Haemorrhage:", and "RT Marked Ventricular Dilatation (>10mm):". Each section has four options: "No", "Yes", "Unclear", and "Non Diagnostic". At the bottom, there is a "Comments:" section with a text input, a dropdown menu set to "Tahoma", a dropdown menu set to "9", and a toolbar with icons for undo, redo, copy, paste, bold, italic, underline, strikethrough, and bulleted list.

PoCUS LIMITED CRANIAL

Examination Date and Time: no time passed Scan Supervised by:

Clinical Reason for Performing Scan:
